Title : Higher Nervous Activity in Ruminant Animals

Orig Pub : Tr. Mosk. vet. akad., 1957, 20, 104-110

Abstract : A conditioned reflex hypoglycemia in response to the effect of a sound that was combined with administration of insulin appeared in sheep with the 22 - 33rd conjunction (i.e., slower than in dogs). In the tagil breed of cattle, conditioned reflex changes in respiration and interchange of gases appeared with the 7 - 14th conjunction, changes of cardiac rhythm and ECG with the 7 - 13th combination of a bell with administration of adrenalin. As compared with dogs, the more rapid acquisition of temporary connections is explained by the

(N.S.)</i>, 1, 86-7 (in English) (1934). -- One cc. of 90% alc. per hundred g. of fruit stops growth and causes full ripeness in 11-17 days. Twelve % alc. does not stop growth and ripening requires 30 days. Untreated fruits require over 25 days. Forty-eight % alc. gave a max. acceleration of ripening. Alc. vapors in a concn. of 1 cc. per 10 l. with an exposure of 24 hrs. gave optimum acceleration of ripening. P. H. Rathmann.</p>

<p>W</p> <p>12</p> <p>Data on the chemistry of the artificial ripening of the Japanese persimmon (<i>Diospyros kaki</i> L.). S. V. Solodanikov. <i>Compt. rend. acad. sci., U. R. S. S.</i> 2, 318-22 (1935); <i>Physiol. Abstracts</i> 30, 540-50; cf. <i>C. A.</i> 30, 2654*. - Persimmons exposed to the vapors of a mixt. of alc. and ethylene become ripe and lose their astringency in 72 hrs.; if they are tightly packed, only the astringency disappears. Their alc. content (estd. by addn. of $K_2Cr_2O_7$ and H_2SO_4, and titration of excess $K_2Cr_2O_7$ by $FeSO_4$) was increased during normal ripening and artificial ripening by ethylene-alc., alc. and CO_2. Hence there is probably no difference in the chemistry of normal and artificial ripening, alc. being produced in both cases through anaerobiosis.</p> <p>R. Hame</p>

Acceleration of the ripening of tomatoes by means of oxygen. S. V. Shtatenkov and M. G. Kuhl. *Ist. na materialy izobrazheniya* 66, 163-67 (1967), (chem. abstr. 1967, 11, 4124; cf. C. A. 20, 2073). Compared to tomatoes ripen in 4-8 days in an atm. contg. over 90% O₂, the optimum concn. being 75-85%. In this O₂ rich atm. CO₂ has only an insignificant stimulating effect as compared to that of the O₂ alone. The respiration of the tomatoes in the O₂ atm. is 50-100% more intensive than in air. The sugar content of the tomatoes is not changed by the action of the O₂. The tomatoes are kept in the O₂ rich atm. only 3-4 days since a more prolonged action of the O₂ interferes with the maturing. M. G. M.

<p>Acceleration of the ripening of citrus fruits by means of ethylene. S. V. Soldatenko, O. A. Grechukhina and R. Kh. Turetskaya. <i>Uchenye Zapiski Leningrad. Gosudarst. Univ., Ser. Biol.</i> 17, No. 35, 103-14 (in English, 115-10) (1930).—Mandarins were treated with C_2H_4 in 675-l. plywood boxes provided with shelves contg. drilled holes. About 1000 fruits were used for each expt. From the end of October the rate of sugar increase in fruit left on the tree fell off rapidly. From July 20 to Dec. 7 the amt. of sucrose doubled. During the last 10 days of November the fruit acquired the color of ripe mandarins. If a nearly ripe fruit is kept on the tree for a longer time it increases in size, but the chem. compn. changes very little. For mandarins prematurely harvested, C_2H_4 treatment can produce all the characteristics of natural ripeness except the sugar content (the difference does not exceed 1-1.5%). The sugar content cannot be increased after the fruit has been taken off the tree. The color of ripe fruit was produced by C_2H_4 treatment after 4-6 "charges" in 8-10 days. Alc. solns. of C_2H_4 gave the same results, except that the soln.-treated fruit spoiled sooner (owing to the effect of alc.). C_2H_4 had no marked effect on the contents of sugar, acid and vitamin C. Lemons were treated in the same manner as mandarins with C_2H_4, and its alc. soln. In general, the effect was the same as with mandarins.</p> <p style="text-align: right;">W. R. The formation of and changes in the organic acids of sprouting cereal seeds. S. V. Soldatenkov, A. N. Pantelev, and T. A. Mazurova. *Tyazhye Leningrad. Oshchashchivaniye* 70, No. 3, 49-57(1950); cf. C.A. 48, 12240a. Mono-, di-, and tricarboxylic acids are always present in cereal seeds and sprouts. In the grains of wheat and rye their content is 0.27-0.35%, and in some varieties of corn as high as 1.18%. In the process of seed sprouting, together with hydrolysis of stored proteins and starches, there is an energetic process of org. acid formation which may increase 3-5-fold the original content in the seeds. Ninety % of the monocarboxylic acids of corn seeds is represented by an unidentified volatile org. acid. Among the di- and tricarboxylic acids malic acid is predominant, while citric and succinic acids are found in smaller quantities. In sprouting corn seeds a profound shift in the quant. ratios of the org. acids takes place, the di- and tricarboxylic types increasing 12-14-fold and the monocarboxylic 3-3.5-fold. The content of monocarboxylic acids in the leaves of seedlings is much lower than in the original grains. In the leaves of wheat and rye seedlings grown in an O-free atm., lactic acid is also formed. No lactic acid was found under similar

SOLDATENKOY, S. V.

Conversion of organic acids during the sprouting and ripening of wheat seeds. S. V. Soldatenkov and T. A. Mazutova (A. A. Zhdanov State Univ., Leningrad). *Biochemistry* 19: 110-66(1964).—Summer and winter varieties of wheat were analyzed following 10-20 days of sprouting and at final maturity. Acetic, malic, citric, and formic acids were found in the sprouts and mature seeds. Acetic acid as a temporary constituent was found in the sprouts only. In the 11-day old sprouts (free from roots) the content of malic acid was increased 4-13 fold and of citric 2-3 fold. Sixty percent of the total di- and tri-carboxylic acids in the sprouts consists of acetic acid. Citric acid predominates in the mature seeds, but constitutes only 10-15% of the total organic acids of the sprouts. As the seeds near maturity, acetic acid disappears and the percentages of other acids undergo a shift.

SOLDATENKOV, S.V.

The effect of light on the conversion of the organic acids of succulent plants. S. V. Soldatenkov and T. P. Ivakova. *Uchenye Zapiski Leningrad. Gosudarst. Univ. im. A. A. Zhdanova* No. 166, Ser. Biol. Nauk No. 39, 18-38(1955).— The authors investigated the rate of digestion of the org. acids of *Bryophyllum* (I) and *Echeveria* (II) in light under natural conditions and in the absence of CO₂. In the absence of CO₂, org. acids are a natural source of carbohydrates for photosynthesis. The digestion of the acids is accompanied by the formation of significant quantities of O₂. The rate of digestion of acids depends on the amt. of chlorophyll in the leaves and is 5-10 times as great in I as in II. An increase in the concn. of CO₂ in the atm. sharply reduces the digestion of acids. The reaction does not occur in powd. leaves. The digestion occurs 12-20 times more rapidly in light than in darkness. J. M. Widom

TITLE: Containment¹ of particles in a fluted system with current

81

SOURCE: Zhurnal tekhnicheskoy fiziki, v. 33, no. 5, 1963, 544-549

TOPIC TAGS: plasma containment, fluted magnetic field, toroidal drift instability

ABSTRACT: Drift equations are used to describe the motion of a particle in a fluted magnetic field, with longitudinal current taken into account. A cylindrical rather than a toroidal coordinate system is used, permitting simplification of the analysis, as drift angle can be considered the same in both toroidal and cylindrical systems. It is shown that under certain conditions of current, magnetic field modulation, and periodicity, resonance particles which lead to increased losses can be eliminated in a closed system with a fluted magnetic field by a longitudinal current along the axis; charge separation and toroidal drift of particles to the walls are thereby prevented.

TITLE: On the equilibrium of a plasma in a spatially periodic magnetic field

SOURCE: Zhurnal tekhn.fiz., v.34, no.2, 1964, 266-268

TOPIC TAGS: plasma, magnetic field, periodic magnetic field, plasma equilibrium, magnetohydrodynamics, pinch, linear pinch, resonance particles

ABSTRACT: A solution of the magnetohydrodynamic equations is obtained which describes an equilibrium state of a plasma filament in a spatially periodic magnetic field. Such a solution is considered to be of interest because it has recently been shown that the resonance particles that occur in these systems can be removed by means of a longitudinal current (R.A.Demirkhanov, T.I.Gutkin, T.R.Soldatenkov, ZhTF, 33,544,1963). The solution was obtained with the aid of an equation derived by R. Lüst and A.Schlüter (Zs.Astrophys.38,190,1955) and under the assumption that both the current and the pressure gradient are proportional to the magnetic flux. For a certain value of the longitudinal current, the periodicity of the magnetic field in the solution obtained disappears, and the solution reduces to that for a linear

Card 1/2

ACCESSION NR: AP4013412

pinch. When the longitudinal current vanishes, the solution reduces to one given by Lust and Schluter (loc.cit.). Orig.art.has: 14 formulas.

TITLE: Interaction of a plasma with high frequency fields in the presence of a constant uniform magnetic field

SOURCE: Zhurnal tekhnicheskoy fiziki, v.34, no.3, 1964, 448-453

TOPIC TAGS: plasma, plasma in alternating field, extraordinary wave, plasma in microwave field, skin effect

ABSTRACT: The interaction of an axially symmetric plasma in a uniform longitudinal magnetic field with an axially symmetric high frequency electromagnetic field is discussed theoretically. The high frequency field is assumed to consist of a longitudinal magnetic field and a transverse electric field (extraordinary wave). The case of a longitudinal high frequency electric field and an azimuthal magnetic field has been previously discussed by others (H.A.Boot, S.A.Self and R.B.R.Shersby-Harvie, J.Elec.Contr., 5, 435, 1958; E.S.Weibel, Ibid. 5, 435, 1958). The motion of the ions and electrons is separated into a rapid component having the frequency of the applied alternating field and the slow component that remains after averaging over a period

Card 1/3

ACC.NR: AP4020571

of the alternating field. The system is described by the two-fluid hydrodynamic equations and Maxwell's equations. Longitudinal and transverse temperatures and pressures are distinguished. In the "zeroth approximation", quasineutrality is assumed and the non-linear hydrodynamic terms, the pressure gradients, and the Lorentz forces due to the magnetic component of the variable field are neglected. To these zeroth approximation equations is adjoined the sum of the "first approximation" equations of motion averaged over a period of the high frequency field. From the resulting equations the particle velocities and two of the three components of the alternating field are eliminated. Two differential equations are thus obtained for the plasma density and the azimuthal electric field as functions of the distance from the symmetry axis. These equations were integrated numerically for several values of the parameters, and some of the results are presented graphically. There are two resonant frequencies. For sufficiently dense plasmas these frequencies are approximately the Langmuir frequency and the geometric mean of the ion and electron Larmor frequencies. When the frequency of the applied field is larger than the mean Larmor frequency, the plasma density increases and the alternating field decreases with approach to the symmetry axis. The mathematical simplification that results when the skin penetration depth is small compared with the radius of the plasma filament is discussed briefly. When the applied frequency is smaller than the mean Larmor

Card 2/3

ACC.NR. AP4020571

frequency, the extraordinary wave penetrates the plasma. In this case the azimuthal electric field amplitude is an oscillatory function of distance from the axis, and the plasma density increases, with superposed oscillations, as the distance from the axis is increased. The criterion for the validity of the approximations employed is that the electron velocity be small compared with the product of the frequency of the applied field and a characteristic length which may be either the skin penetration depth or the wavelength. "In conclusion the authors express their gratitude to R.A.Demirkhanov for his interest in the work and for discussions." Orig.art.has: 20 formulas and 4 figures.

ORG:	none
TITLE:	Entrainment of a plasma by a rotating electromagnetic field
SOURCE:	Zhurnal tekhnicheskoy fiziki, v. 35, no. 10, 1965, 1749-1754
TOPIC TAGS:	^{21, 44, 55} <u>plasma stability</u> , ^{44, 55} <u>plasma dynamics</u> , <u>magnetohydrodynamics</u> , rotation, rotating magnetic field
<p>ABSTRACT: The entrainment of a plasma cylinder in a uniform magnetic field by a rotating electromagnetic field is discussed in the magnetohydrodynamic approximation. The calculations were undertaken because rotation of a plasma cylinder can be useful in prolonging its life, in suppressing flute instability, and possibly in heating it. The rotating electromagnetic field discussed is that due to currents proportional to $\exp i(f t + m \theta)$ in the z direction on a cylindrical surface coaxial with the plasma cylinder. Here r, θ, z are cylindrical coordinates, f is the frequency, and m is an integer. The magnetohydrodynamic equations are solved by a successive approximation method based on expansion in powers of the ratio of the strength of the alternating magnetic field to that of the uniform axial magnetic field. In the zeroth approximation the plasma is assumed to be at rest. The first approximation describes the distribution of the high frequency fields in the plasma, but the plasma motion appears only in the</p>

L 7727.66

ACC NR: AP5025883

15

second approximation. In order to obtain the second approximation it is assumed that the entrainment time is long compared with the period of the high frequency field, and all quantities are separated into slowly-varying and high-frequency parts. In the second approximation there appear radial and azimuthal motions of the plasma, a radial electric field, and an azimuthal current. The second approximation describes only the initial stages of the plasma entrainment because the reaction of the plasma motion on the field appears only in higher order approximations, which are not calculated in general form. The entrainment time is estimated under further restrictive assumptions. The effect on the entrainment process of the finite plasma lifetime and the possibility of instabilities due to the rotational velocity gradients and the azimuthal currents must be further investigated. The authors thank R.A. Demirkhanov and T.I. Gutkin for suggesting the problem and for their stimulating interest, and A.A. Rukhadze, L.I. Rudakov, and D.P. Kostomarov for valuable discussions. TITLE: The motion of charged particles in constant and rotating magnetic fields

SOURCE: Zhurnal tekhnicheskoy fiziki, v. 36, no. 2, 1966, 246-249

TOPIC TAGS: plasma confinement, rotating magnetic field, longitudinal magnetic field, magnetic mirror,

21, 22, 23

ABSTRACT: The author is concerned with the motion of a plasma in the simultaneous presence of a constant longitudinal magnetic field and a rotating transverse magnetic field. This problem is of interest in connection with the confinement of plasma in a magnetic mirror system. The motion of separate charged particles in combined constant and rotating magnetic fields has previously been treated by A. Legatowicz (Nuclear Fusion, 1, No.3, 161, 1961) and the motion of a plasma has been treated in the hydrodynamic approximation by V.P.Sidorov and the author (ZhTF, 35, 1749, 1965). In the present paper the motion of a plasma is treated in the drift approximation under the assumptions that the strength of the transverse rotating component of the magnetic field is small compared with that of the constant longitudinal component and that the field rotation frequency is small compared with the Larmor frequency. It is found

Card 1/2

L 23102-66

ACC NR: AP6007071

2
that when the rotation frequency of the field exceeds a certain value the motions of both ions and electrons are finite and independent of the direction of rotation of the magnetic field. At lower field rotation frequencies (or higher relative strength of the rotating field component) the motions are finite only when the angular velocity vector of the rotating field component is in the direction of the constant field component. In a plasma with a finite number of particles and a sufficiently low collision frequency there develops a condensation of electrons in the plane of the rotating component of the field. This condensation rotates with the field and can drag the ions along. The author thanks R.A. Demirkhanov and T.I. Gutkin for discussing the results. Orig. art. has: 9 formulas.

TITLE: Experience With Electric Prospecting in Winter Conditions

PERIODICAL: Razvedka i okhrana nedr, 1959, Nr 5, pp. 48-49 (1)

ABSTRACT: The author describes a special electrode which permits electric prospecting in winter. The electrode must be longer than usual - about 1.2 to 1.5 m long, made of a hard steel and of conical form to facilitate its driving into the frozen soil with a sledge hammer. It must have a ring on its top to permit its extraction. When a brass or copper electrode is used - the hole must be made with a steel electrode of the same diameter, then the brass electrode is placed in the prepared hole. As a measuring device the EF-1 potentiometer, constructed by the Geologorazvedka Plant, was used. There are 2 diagrams.

TITLE: Snow compactor for winter road construction

SOURCE: Transportnoye stroitel'stvo, no. 9, 1965, 50

TOPIC TAGS: roadbuilding equipment, construction machinery, snow/ KDM 100 tractor

ABSTRACT: A snow compacting machine ⁴⁴for winter road construction is described. It consists of four major components: a tractor (KBM-100; 100 hp), a snow loosener consisting of a toothed cutter, a heating chamber in which fuel from six injector nozzles is burned, and a vibrating compactor with unbalanced rotating weights. The machines specifications are: width of path, 2.8 m; cutter speed, 300--350 rpm; vibrator frequency, 2500--3000 cpm; 8 m long, 1.8 m high, 3 m wide; 2 km/hr capacity; compacted snow density (for 70 cm deep snow layer) 0.62--0.64 gm/cm³; weight, 10 tons. For snow depths < 50 cm the road path has to be

Card 1/2

UDC: 625.08

L 10290-66

ACC NR: AP5028787

prepared before the snowfall to remove tree stumps, etc. The snow compactor forms a compacted snow-ice layer which will support conventional vehicles after 10--12 hours after passage of the compactor. The compactor provides 2--2.5 times labor saving and 1.5--2 times economic savings over existing methods. Orig. art. has: 1 figure. J

SOLDATKIN, A.L.

Making self-fluxing manganese ore sinter. A. I. Soldatkin. Stal' 15, 497-500 (1956).—By smelting FeMn in a blast furnace, it was observed that, before being reduced, almost all the MnO dissolved in the slag which contained in the boshes 40-60% MnO and that CaO in the slag reduced its satn. with MnO. This suggested the use of sinter high in CaO. Plant-scale sintering expts. were conducted by using ore carrying MnO 65.0, SiO₂ 0.28, and CaO 1.03%. The influence of moisture, thickness of sintering layer, C content of the mix, dimensions of coke and limestone particles, and the percentage of returns were examd. as a function of sinter quality and production. Effect of moisture was detd. by using a charge of ore 71, returns 15, limestone 14, and C 5.3% held in a layer 350 mm. thick. Best gas permeability, optimum sintering speed, best yield of good sinter, min. of 0-8-mm. fines, max. contraction of the charge, and highest temp. of the waste gases were recorded with 7-8% moisture. Best thickness of sintering layer for the same charge was 350-400 mm. and optimum C content 5%. Coke ground to pass a 6-mm. sieve and limestone smaller than 6 mm. produced best av. results. Proper temp. requires the use of returns, but more than 15% of them had no point. I. D. Gat

Soldatkin, A.I.

Material balance in the process of agglomeration of manganese ore. A. I. Soldatkin. Trudy Leningrad. Politekh. Inst. 1955, No. 170, 71-9; Referat. Zhur., Met. 1956, No. 1883. — Material balances for agglomeration of Mn ore without flux and with addn. of 14% lime are given. It was found that without addn. of lime considerable reduction of Mn_2O_3 to MnO occurred, while with lime part of MnO was oxidized to Mn_2O_3 . Agglomeration removes ~75% S. Compn. of by-product gases was characterized by high content of CO_2 and CO. The cumulative O content of gases was higher than atm. V. N. Bednarski

TITLE: The use of gas coals in blends of the Southern Coking Plants.
(Ispol'zovaniye Gazovyykh ugley v shikhtakh yuzhnykh koksokh-
imicheskikh zavodov.)

PERIODICAL: "Koks i Khimiya" (Coke and Chemistry),
1957, No. 2, pp. 20 - 23, (U.S.S.R.)

ABSTRACT: An experimental blend containing 30% of gas coals instead
of the usual 15% was used for one month in the Zhdanov Coke
Ovens and the coke produced tested on a No. 1 blast furnace
in the Azovstal' Works and No. 2 furnace in the Il'ich Works.
The composition and properties of the usual and the experi-
mental coal blends (Tables 2, 3), coking balances (Table 4),
and properties of coke produced (Tables 5, 6, 7) are given.
Operational data of blast furnaces on normal and experi-
mental cokes are given in Table 8. The mean size of coke
decreased from 60.85 mm to 58.74 mm. This decrease in the
size of coke had only a small effect on the blast furnace
operation.
There are 8 tables and 4 Russian references.

Kyyiv. Ukrayins'kyi naukovo-doslidnyy instytut metaliv

Vprovadzhennya novoyi tekhniki i tekhnologiyi na metalurhiynykh zavodakh
Ukrayiny; zbirnyk, t. 3 (Introduction of New Techniques and Technology
in Ukrainian Metallurgical Plants; Collection of Articles, Vol. 3) Kyyiv,
Derzhtekhvydav URSR, 1958. 192 p. 1,000 copies printed.

Exec. Ed.: H. Afonina; Tech. Ed.: P. Patsalyuk.

PURPOSE: The book is intended for metallurgists employed in rolling and
slabbing operations.

COVERAGE: This is a collection of 11 Ukrainian articles, compiled by 22
authors, some of whom are referred to as eminent specialists. The subjects
dealt with in the articles are: use of limestone-fluxed slag in making pig
iron, use of blast-furnace gas under increased pressure, use of oxygen in
making steel in open-hearth and Bessemer furnaces, description of a new
method of "intensified" squeezing of slabs in blooming mills. Some design
details, with direct references to actual plants and certain operational

Card 1/4

Introduction of New Techniques (Cont.)

SOV/1574

practices are also featured. Introduction of full mechanization of rolling processes at steel-works is taking place. Numerous diagrams accompany the text. Some articles have bibliographic entries, mainly Soviet.

M.I. Kurmanov, M.P. Lave, V.P. Onopriyenko, V.A. Tikhovskiy, and
Ya. A. Shneyerov; Ed.: S.S. Liberman; Tech. Ed.: K.O. Gurin

PURPOSE: The book is intended for the scientific personnel of
institutes and for engineers and technicians of metallurgical
enterprises and other branches of the industry.

COVERAGE: The collection of articles reviews the work carried on at
the Institute of Metals on the technology of blast furnaces, open-
hearth furnaces, and rolled stock production. It also deals
with problems in metallurgy, heat treatment of ferrous metals
and methods for their study. Particular attention is devoted to
the preparation of charges and blast furnace practice with increased
blast pressure, open-hearth production with oxygen blast and rolling
of light profiles. No personalities are mentioned. References
accompany each article.

TITLE: Quantitative characteristics of the development of plague
epizootic in *Rhombomys optimus* colonies

SOURCE: Zoologicheskii zhurnal, v. 45, no. 4, 1966, 481-486

TOPIC TAGS: ~~human ailment, epizootic~~, plague, disease vector, ~~gerbil~~,
flea, ANIMAL PARASITE, EPIZOOTIOLOGY, INFECTIVE DISEASE,
ANIMAL DISEASE, RODENT

ABSTRACT: The process of the infection of fleas infesting diseased
gerbils (*Rhombomys optimus*) was studied using radioactivity labeled
materials to simulate disease agents in a model experiment. Results
were compared with those obtained with plague-infected gerbils. The
number of fleas feeding on one gerbil were recorded, as well as the
distribution of these fleas after five or six days. Calculations based
